

1           CLAIMS

2           We claim:

3           1.       A method comprising:

4           receiving a plurality of task containers representing a plurality of tasks,  
5           where each task container is a grouping of either task containers or resource  
6           containers, which describe one or more resources required for the represented task;  
7           generating a cost for each task based on probabilities that the task will  
8           influence each other task in the plurality of tasks using the containers; and  
9           scheduling the task with the least cost.

10  
11           2.       A method as recited in claim 1 wherein the resources information  
12           comprises container information describing how to select the one or more tasks or  
13           resources.

14  
15           3.       A method as recited in claim 2 wherein the container information  
16           comprises at least one of:

17           an “AND” relationship indicating that all of the one or more tasks or  
18           resources are required;

19           an “XOR” relationship indicating that only one of the one or more tasks or  
20           resources is required; and

21           an “OR” relationship indicating that one or more of the one or more tasks or  
22           resources are required.

23  
24           4.       A method as recited in claim 1 further comprising:

1 receiving a timeslot definition associated with each of the plurality of tasks  
2 or resources, the timeslot definition defining a required timeslot for the associated  
3 task or resource.

4

5 5. A method as recited in claim 4 wherein the timeslot definition  
6 comprises an early start indicator, a late finish indicator, and a duration indicator.

7

8 6. A method as recited in claim 1 further comprising:  
9 receiving a constraint describing a time constraint between two tasks in the  
10 plurality of tasks; and  
11 scheduling the two tasks based on the constraint.

12

13 7. A method as recited in claim 1 wherein the generating comprises:  
14 determining a probability that a first task in the plurality of tasks influences  
15 a second task in the plurality of tasks based on the resource information; and  
16 adjusting the cost of the first tasks based on a function of the probability  
17 that the first task in the plurality of tasks influences the second task in the plurality  
18 of tasks.

19

20 8. A method as recited in claim 1 wherein the generating comprises:  
21 determining a probability that a first task in the plurality of tasks supports a  
22 second task in the plurality of tasks based on the resource information; and  
23 if the first task supports the second task, reducing the cost of the first task  
24 based on a function of the probability that the first task supports the second task.

1        9. A method as recited in claim 1 wherein the generating comprises:  
2              determining a probability that a first task in the plurality of tasks competes  
3              with a second task in the plurality of tasks based on the resource information; and  
4              if the first task competes with the second task, increasing the cost of the  
5              first task based on a function of the probability that the first task competes with the  
6              second task.

7  
8        10. A method as recited in claim 1 wherein the generating comprises:  
9              selecting a first task from among the plurality of task;  
10             for each of the other tasks in the plurality of tasks, determining a pair-wise  
11             probability, the pair-wise probability representing a probability that the first task  
12             will compete with the other task; and  
13             summing the pair-wise probabilities to form a total cost associated with the  
14             first task.

15  
16       11. A method as recited in claim 1 wherein the resource information  
17           comprises preference information describing preferences of the one or more  
18           resources.

19  
20       12. A method as recited in claim 1 wherein the generating comprises  
21           applying preference values to the tasks.

22  
23       13. A method as recited in claim 1 wherein the generating comprises  
24           tabulating a cost associated with each pair of tasks.

1        14. A method as recited in claim 1 further comprising:  
2              removing the scheduled task from a main task log;  
3              adjusting probabilities associated with resources remaining in the main task  
4        log based on the scheduled task; and  
5              re-generating a cost for each task based on probabilities that the task will  
6        influence each other task in the plurality of tasks using the resource containers.  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

1        15. A processor-readable medium having processor-executable  
2 instructions for performing a method comprising:

3            receiving a plurality of first resource descriptors describing first resources  
4 associated with a first candidate task and selection criteria defining how the first  
5 resources are to be selected from the plurality of first resources;

6            receiving a second resource descriptor describing a resource associated with  
7 a second candidate task; and

8            scheduling one or more of the first candidate task and the second candidate  
9 task, wherein one or more of the first resources are allocated to the first candidate  
10 task in accordance with the selection criteria.

11  
12        16. A processor-readable medium as recited in claim 15 wherein the  
13 scheduling comprising:

14            identifying one or more of the first resources that are not the same as the  
15 second resource and that satisfy the selection criteria.

16  
17        17. A processor-readable medium as recited in claim 15 further  
18 comprising:

19            receiving a current schedule state having currently scheduled tasks and  
20 currently scheduled resources;

21            determining whether the first candidate task and the second candidate task  
22 are viable based on the current schedule state; and

23            eliminating one or more of the first or second candidate task from  
24 consideration if the one or more of the first or second candidate task is not viable.

1        18. A system for scheduling a plurality of tasks, the system comprising:  
2              a task log including a plurality of task objects representing tasks, the task  
3              objects having resource objects representing a resource required for the associated  
4              task, each of the task objects operable to return a probability that scheduling of the  
5              task will influence another task;  
6              a cost generator operable to generate a cost for each of the tasks based on  
7              probabilities that the task will influence each other task; and  
8              a scheduling engine operable to schedule the task with the least cost.

9

10        19. A system as recited in claim 18 wherein the task log further  
11              comprises a resource container defining a function of a plurality of resources.

12

13        20. A system as recited in claim 19 wherein the function comprises one  
14              of:

15              an “AND” function indicating that all of the plurality of resources are  
16              required;

17              an “XOR” function indicating that one and only one of the plurality of  
18              resources is required; and

19              an “OR” function indicating that at least one of the plurality of resources is  
20              required.

21

22        21. A system as recited in claim 18 wherein the cost generator is further  
23              operable to calculate pair-wise costs representing a cost of scheduling a first task  
24              relative to a second task.

1        22. A system as recited in claim 18 wherein the cost generator is further  
2 operable to tabulate pair-wise costs representing a cost of scheduling a first task  
3 relative to a second task and generate a total cost associated with each of the tasks.

4

5        23. A system as recited in claim 18 wherein the task object further  
6 comprises time constraint information indicating at least one time constraint  
7 between two of the tasks.

8

9        24. A system as recited in claim 18 wherein the task log further  
10 comprises a hierarchical arrangement of the task objects and the resource objects.

11

12        25. A system as recited in claim 18 wherein each task object is operable  
13 to return a probability that the task object competes with another task object.

25

1        26. A method comprising:

2            generating a cost associated with each of a plurality of tasks to be  
3            scheduled;

4            executing a minimum cost task; and  
5            scheduling the minimum cost task if the minimum cost task successfully  
6            executes.

7

8        27. A method as recited in claim 26 wherein the generating comprises  
9            determining a pair-wise probability representing a probability that a first task in the  
10          plurality of tasks conflicts with a second task in the plurality of tasks.

11

12       28. A method as recited in claim 27 further comprising adjusting the  
13          pair-wise probability in response to scheduling the minimum cost task.

14

15       29. A method as recited in claim 26 wherein the generating comprises  
16          determining the costs based upon preference weights assigned to the plurality of  
17          tasks.

18

19       30. A method as recited in claim 26 further comprising determining  
20          viability of each task in the plurality of tasks.
